

For my organization in my Github, I made a few extra folders but not an insane amount. Personally, I'm a very organized person so adding the folders really helped me keep a good piece of mind.

To begin, I made one folder for all of my modules in the class (I titled this folder "Modules"). Next, I moved all of the PDF files that I had associated with the modules into that folder so all of my documents were in one singular place. Inside of my "Modules" folder, I made another folder titled "Module6" because that specific module had a lot of different elements to it.

Next, I made another folder in my main "home" repository that is titled "Portfolio" and inside of that one I made two additional folders called "Photos" and "WorkSamples". I chose these names because these are the two main document types that I plan on displaying in my portfolio. This way, I will be able to easily find the photos that I upload for my photography page and the work samples for my work page.

Overall, I think that my organization makes sense to me and is personalized perfectly for my portfolio.
